

Veteran

Hip Condition(s) Medical Impairment Assessment

Insert conditions:								
For this assessment, each condition needs to be assessed in isolation from all others. This means that when assessing a condition, you will need to assess								
the impairment as though only that single condition is present, and that the veteran is otherwise healthy and normal. If it is not possible to separate the								
impairment in this way, please select a description of the total impairment rating under "combined conditions."								
For the purposes of this form, "difficulty" refers to an activity being hard to perform, because of an actual, observable limitation or impediment. Difficulty may be evident through the use of splints, aids, rails, or personal assistance, or through the exertion of additional effort to complete the task. Voluntary avoidance of physical activity to minimise pain cannot be considered. Where possible, your assessment should be based on your observation and examination of the veteran, as well as their history and any relevant investigations. 1. Please select the most accurate description of impairment to active range of movement (ROM) of the hip, due to each condition in isolation. Consider motion in all planes of movement.
